The encoded xylanase, and xylanases derived from Humicola, Thermoascus, Chaetomium, Mucor, Talaromyces, Malbranchea, Myceliophthora, Thielavia, Byssochlamus or Paecilomyces strains can be used in the monocomponent xylanase preparations of the invention. The xylanase preparations and the recombinant Thermomyces xylanase are useful as animal feed additives, which promote in-vivo breakdown of plant cell wall material and thus improve digestibility, growth rate and/or feed conversion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence

                                                                                                                                                                                                                                                The sequence encodes an endo-1,4-beta-D-xylanase from Thermomyces lanuginosus (Humicola lanuginosa), which may be used as a breadimproving additive. The enzyme may be expressed recombinantly from a plasmid pYES2.0 vector in Saccharomyces cerevisiae DSM 10133 (claimed), and may be added to flour at 5-5,000 (preferably 20-2,000) FXU/kg flour, optionally along with other enzymes (amylase, maltogenase, lipase, cellulase, hemicellulase, pentosanase, glucose- oxidase, laccase, protease and/or peroxidase). The enzyme combines particularly well with amylolytic enzymes, and may be used to improve baking properties of flour and/or dough, by increasing volume and improving texture, flavour, crumb softness, freshness and anti-staling properties, while improving dough machinability and stability. (I) or its coding sequence (II) is useful for degrading or modifying plant cell wall or for processing a plant material by contacting the plant cell wall or plant material with (I) or (II). (I) is useful for modifying plant materials, and in baking, processing cereals, starch production, processing wood and enhancing the bleaching of wood pulp. (I) is useful for altering the viscosity derived from the presence of hemicellulose or arabinoxylan in a solution or system comprising plant cell wall material. (I) is useful for preparing a foodstuff such as bread, pretzels, tortillas, cakes, cookies, biscuits or crackers. The present sequence represents the coding sequence of Thermomyces lanuginosus xylanase A as described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       heterologous nucleotide sequence encoding a polypeptide of interest, where the codon usage of the sequence has been adjusted to match the preferred codon usage of P. methanolica. The invention also relates to a method for producing high yields of heterologous codon optimised polypeptide in a Pichia cell. The Pichia cell is useful for producing a polypeptide of interest, where the polypeptide is encoded by a nucleotide sequence heterologous to P. methanolica. The present sequence is Thermomyces lanuginosus codon optimised xylanase gene which is the heterologous DNA used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         09-MAR-2001;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Thermomyces Synthetic.

14-NOV-1995
                                A DNA fragment (AAQ74098) encoding H. insolens xylanase isolated from pYES (DSM 6995) and inserted into pHD414 (promoter and AMG terminator) to form pAXX40-1-1-1. This pJaL77 (imparting hygromycin B resistance) were used to t protoplasts of A. foetidus NO953. The xylanase yield was (Updated on 25-MAR-2003 to correct PN field.) (Updated or correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-DEC-1993;

Cenzyme such as tannase, cellulase, plucose oxidase, glucoamylase, ce phytase, beta-galactosidases, invertase, lipase, alpha-amylase, laccase, compositions comprising the tannase are cuseful for modulating the amount of compositions comprising cellulase are cuseful for modulating the amount of compositions comprising cellulase are compositions comprising cellulase are compositions comprising cellulase are compositions compositions comprising cellulase are compositions comprising cellulase are useful for modulating the amount of composition. Compositions comprising phytase are useful for modulating the amount of myo-inosition comprising cellulase are useful for modulating the amount of laccose in a composition. Compositions comprising sucrase or invertase are useful for modulating the amount of compositions comprising lipase are useful for composition in a composition composition compositions comprising alpha-amylases are useful for modulating the amount of composition. Compositions comprising lipase are useful for composition composition compositions comprising lipase are useful for modulating the amount of compositions comprising comprising comprising the amount of composition compositions comprising composition compositions comprising composition compositions compositio

Novel isolated Aspergillus fumigatus industries such as those involved in beverages, textiles and detergents. polypeptide, useful in the making of food and various feed,

Claim 2; 165-66; 169pp; English

The sequences given in ABQ80319-66 encode enzymatic proteins derived from CC A. funigatus. The resulting proteins display the catalytic activity of an CC enzyme such as tannase, cellulase, glucose oxidase, glucosenylase, phytase, beta-galactocosidases, invortase, lipase, alpha-amylase laccase, collygalacturonase or xylanase. Compositions comprising the tannase are useful for modulating the amount of cellulase in a composition. Compositions comprising cellulase are useful for modulating the amount of cellulase in a composition. Composition comprising phytase are useful for modulating the amount of cellulase in a composition. Composition comprising comprising phytase are useful for modulating the amount of a composition. Compositions comprising comprising the amount of plucose oxidase are useful for modulating the amount of phytase are useful for modulating the amount of myo-inositol phosphates or modulating the amount of glyceride in a composition. Compositions comprising phytase are useful for modulating the amount of glyceride in a composition composition comprising phytase are useful for modulating the amount of camposition comprising comprising sucrase or maltodestring in a composition composition comprising comprising slipase are useful for modulating the amount of phytase are useful for modulating the amount of oxidated phenolic composition composition. Compositions comprising comprising polygalacturonases are useful for modulating the amount of oxidated phenolic composition composition. Compositions comprising comprising polygalacturonases are useful for modulating the amount of oxidated phenolic composition. Compositions comprising polygalacturonases are useful for modulating the amount of oxidated phenolic composition composition. Compositions comprising comprising polygalacturonases of the accuse of the phytagetus proteins and corresponding DNA s are useful for modulating the amount of xylan or xylo-oligomers to identify duplicated genes of paralogs having the amount of paralogs and making of food capt

The sequence can be insert into the plasmid pQE60 to generate plasmid FERM P-16713 for expression e.g. E.coli. The xylanase is useful for the preparation of xylooligosaccharide from xylan and for pulp-bleaching. (Updated on 27-AUG-2003 to correct OS field.)

The sequence can be inserted into the plasmid pQE60 to generate plasmid FERM P-16713 for expression in e.g. E.coli. The xylanase is useful for the preparation of xylooligosaccharide from xylan and for pulp-bleaching. (Updated on 27-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                               This sequence encodes an A. niger (hemi)cellulase NBE021. The (hemi)cellulase coding sequences of the invention are derived from a filamentous fungus, preferably Aspergillus niger. The (hemi)cellulase is useful in producing dough, which is useful for preparing a baked product such as bread, biscuits from the dough. Fragments of the (hemi)cellulase is the useful as probes and primers for detecting the expression of (hemi)cellulose mRNA in a biological sample such as a tissue. They are calated sequences. Anti-(hemi)cellulase antibodies are useful for qualitative or quantitative determination of a polypeptide in a biological sample. These antibodies are useful in diagnosing organism is infected with Aspergillus. The dough prepared by using the inventive (hemi)cellulase has increased strength, elasticity, stability, reduced stickiness, improved extensibility and machinability. The grepared baked product has improved crumb structure, softness and flavour. The (hemi)cellulase has higher specificity towards the substrate, is less antigenic and produces less undesirable side
